SC-100: Designing Security Operations, Identity, and Compliance Capabilities

Design security operations for one estate

Tim Warner

Principal Author | IT Ops | Pluralsight

TechTrainerTim.com

Here’s what we’ll design together

Security operations

Identity

Privileged access

Compliance

Checking in with Globomantics

Identity, endpoint, and plant signal live in three workspaces

An analyst is thirty minutes in with three browser tabs open

Security headcount is flat for the fiscal year

Where does the first budget dollar go?

Split the signal between XDR and SIEM

What XDR and SIEM each do best

XDR	vs.	SIEM
Correlates first-party signal deeply		Ingests everything else broadly
Endpoints, identities, cloud apps, email, OT		Connectors for third-party and custom sources
Built-in and custom detections and investigations		Supplied and custom analytics planned retention
Depth across connected security products		Breadth with ingestion and retention costs

Where each signal should land

Microsoft-owned surfaces: identity, endpoint, email, and cloud apps, correlated natively by XDR

Everything else: firewalls, plant historians, and third-party SaaS, ingested by Sentinel

The unified surface: Sentinel and Defender XDR both run in the Microsoft Defender portal

Paid for twice: the same source in both systems with no stated reason

Design audit retention before the investigation needs it

An investigation reconstructs only what you kept

Scope: which activities are audited at all

Retention tier: Microsoft Purview Audit Standard and Premium differ, so state the tier

Access: who can read the record, and whether that path survives the compromise

AI and Copilot interactions: the same audit log, and new surface area you now own

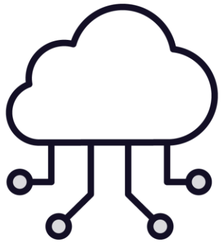

Extend monitoring across hybrid and multicloud

Coverage you inherit and coverage you design

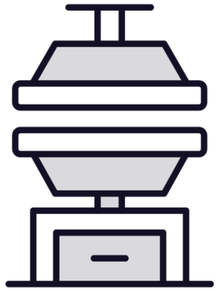

Azure Arc:

extends the Azure control plane to machines that don't live in Azure

The estate nobody owns:

AWS workloads from an acquisition, no owner and no budget line

Eleven plants:

the security team has never logged into the floor

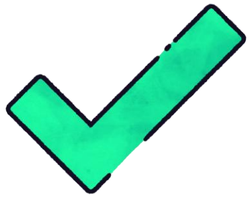

Microsoft Learn, Microsoft Sentinel retirement timeline

“After March 31, 2027, Microsoft Sentinel will no longer be supported in the Azure portal and will be available only in the Microsoft Defender portal.”

Citation: Microsoft, “What is Microsoft Sentinel?”, learn.microsoft.com/azure/sentinel/overview

Automate to buy analyst attention

Automation: do and don't

Do

Automate the enrichment every analyst does by hand

Use automation rules to route, tag, and assign at scale

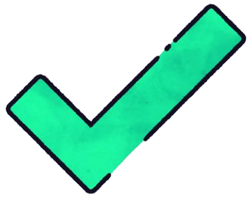

Don’t

Don't automate an action you can't reverse

Don't isolate a plant floor device on a rule alone

Automation: do and don't

Do

Let Defender XDR self-heal the alerts it raised itself

Measure automation in analyst hours returned

Don’t

Don't buy automation to make the alert count fall

Don't hide a decision an auditor will want to see

Separate incident response from threat hunting

Incident response: speed, and explicit escalation criteria

Threat hunting: breadth, and retention long enough to ask a new question

Incident management: the record that survives a shift change

Three workflows, three different data needs

Measure detection coverage against MITRE ATT&CK

Turn coverage into evidence

Map what you already detect onto ATT&CK techniques

Prioritize the gaps that matter to this estate

Enterprise, Mobile, and ICS are separate matrices

Present the map as evidence, not as a yes or no

The architect's read on Globomantics

“An ICS matrix exists because plant floor coverage isn't inherited from enterprise coverage.”

Reference: MITRE ATT&CK matrices for Enterprise, Mobile, and industrial control systems

Demo: Investigate one incident across three signals

Walk a single incident across identity, endpoint, and cloud signal in the Microsoft Defender portal, then read detection coverage against the ATT&CK matrix

Relevant SC-100 practice question

Globomantics will fund one initiative this year

Question

Three workspaces hold identity, endpoint, and plant signal. Headcount is flat and analysts pivot by hand. What do you recommend?

A. Buy more detection content for each workspace

B. Consolidate onto the unified Defender portal surface

C. Add a new SIEM and forward all three workspaces to it

D. Raise the retention period on all three workspaces

Globomantics will fund one initiative this year

Answer: B

Three workspaces hold identity, endpoint, and plant signal. Headcount is flat and analysts pivot by hand. What do you recommend?

A. Buy more detection content for each workspace

B. Consolidate onto the unified Defender portal surface

C. Add a new SIEM and forward all three workspaces to it

D. Raise the retention period on all three workspaces

Checking out with Globomantics

Say which signal belongs where, and defend the cost

Design audit scope and retention before you need them

Automate what you can reverse, and measure it in hours

Show coverage as evidence rather than asserting it
