SC-100: Designing Security Solutions for Infrastructure

Design posture management that follows the attack path

Tim Warner

Here’s what we’ll work on together

Posture management

Specify endpoint security

Set requirements for different workload types

Finish at the network

Checking in with Globomantics

The AWS workloads from the acquisition still have no owner

On-premises servers sit outside Azure and outside the score

Security headcount is flat for the fiscal year

What do you fund first: score, inventory, or attack map?

Evaluate posture with the Microsoft cloud security benchmark

Measure the estate against the benchmark

Default initiative: assigned when Defender for Cloud is enabled

Continuous assessment: recommendations where resources fall short

Added standards: PCI-DSS, ISO 27001, and NIST beside the benchmark

Measure posture with Microsoft Secure Score

Name the score before you report it

Score	What it measures	Where you read it	Use it to
Microsoft Secure Score	Identity, devices, apps and data	Microsoft Defender portal	Track recommended actions
Cloud Secure Score	Multicloud resources, weighted by risk	Defender portal, Exposure Management	Prioritize risk
Classic Secure Score	Healthy resources per security control	Azure portal, Defender for Cloud	Track control completion

Keep the model and assessed scope consistent when comparing results.

Design one posture view across Azure, AWS, and on-premises

Globomantics posture coverage

Globomantics design

Azure order workload

Native Azure resources

Native assessment

Acquired cloud estate

Organization / account scope

Supported cloud connector

Datacenter file server

Stays in the plant network

Azure Arc

Defender for Cloud

MCSB assessments
Recommendations
Risk context and paths

Connect the assessed estate before interpreting its score.

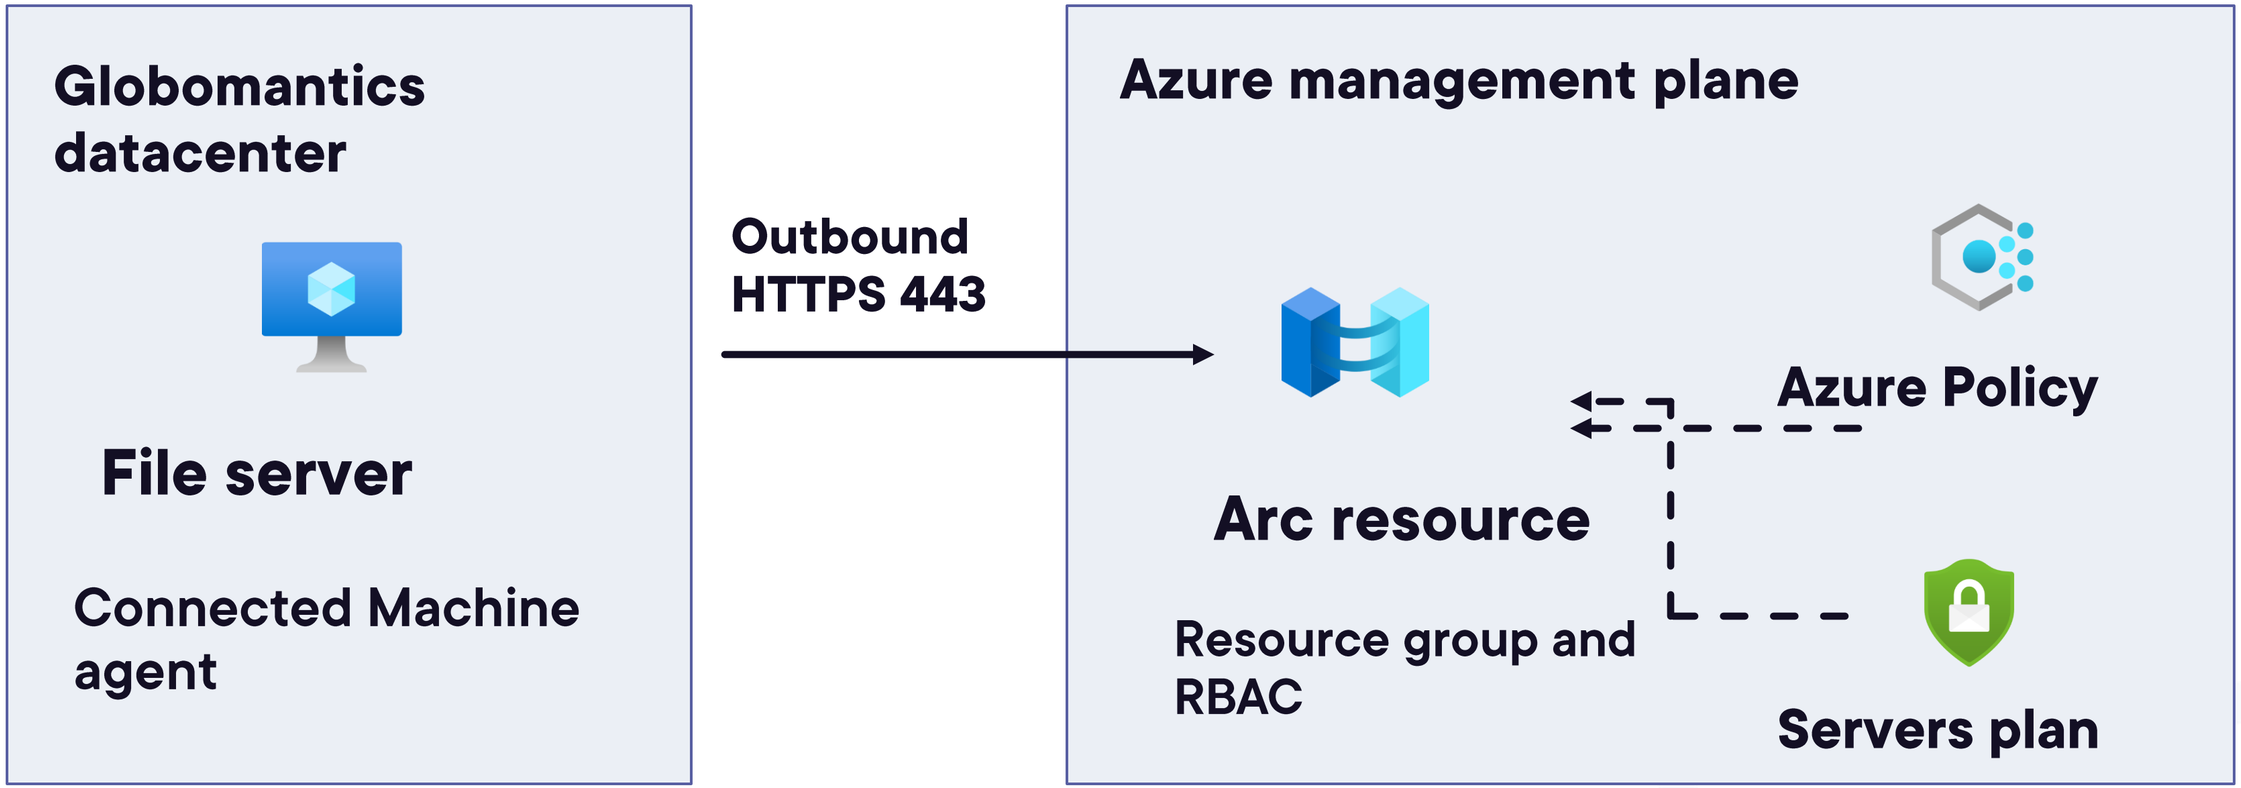

Choose the tier by what the subscription holds

Foundational CSPM	vs.	Defender CSPM
Free, and enabled on purpose		**Attack paths and cloud security explorer**
Benchmark recommendations and secure score		**Agentless scanning for vulnerabilities**
Remediation tracked by hand		**Governance: owners and due dates**
Fits dev, test, and low-risk subscriptions		**Fits production and sensitive data**

Bring non-Azure machines under management with Azure Arc

Azure Arc across the management boundary

Globomantics design

Management permission can lead to changes inside the guest.

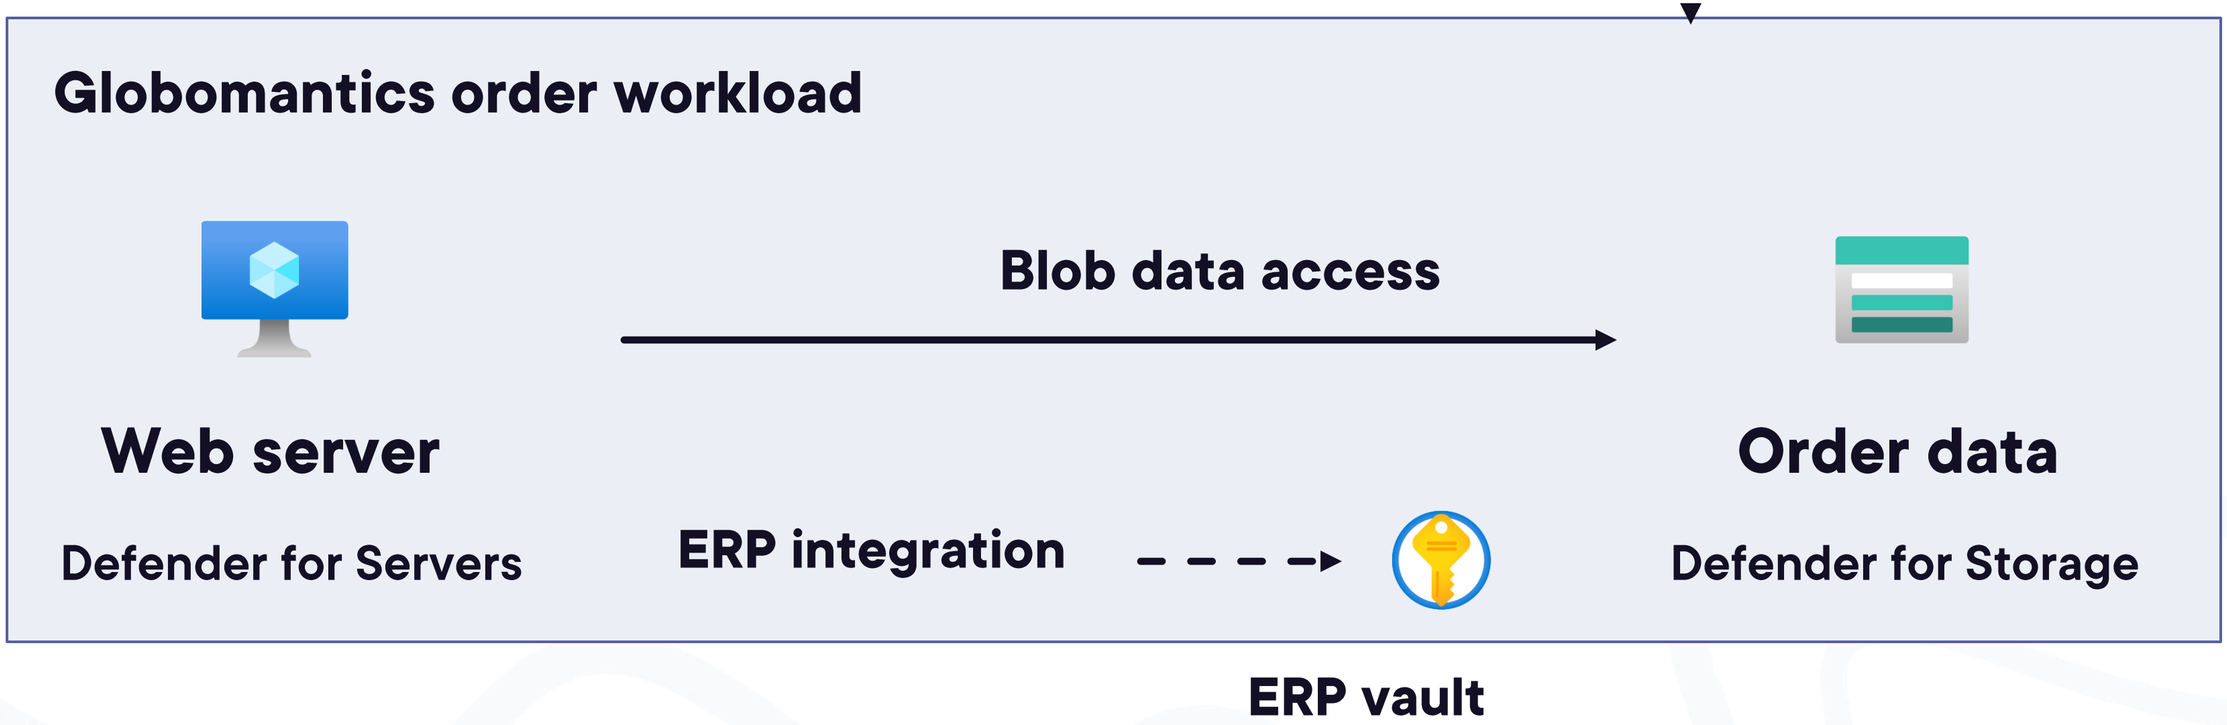

Select workload protection plans by risk

Workload protection follows the dependency

Globomantics design

Administrator / deployment identity - - - - - - - - → **Azure Resource Manager**

Management-operation detection

A shared service increases priority only where a workload depends on it.

Map the external attack surface with Defender EASM

See the estate from the attacker's side

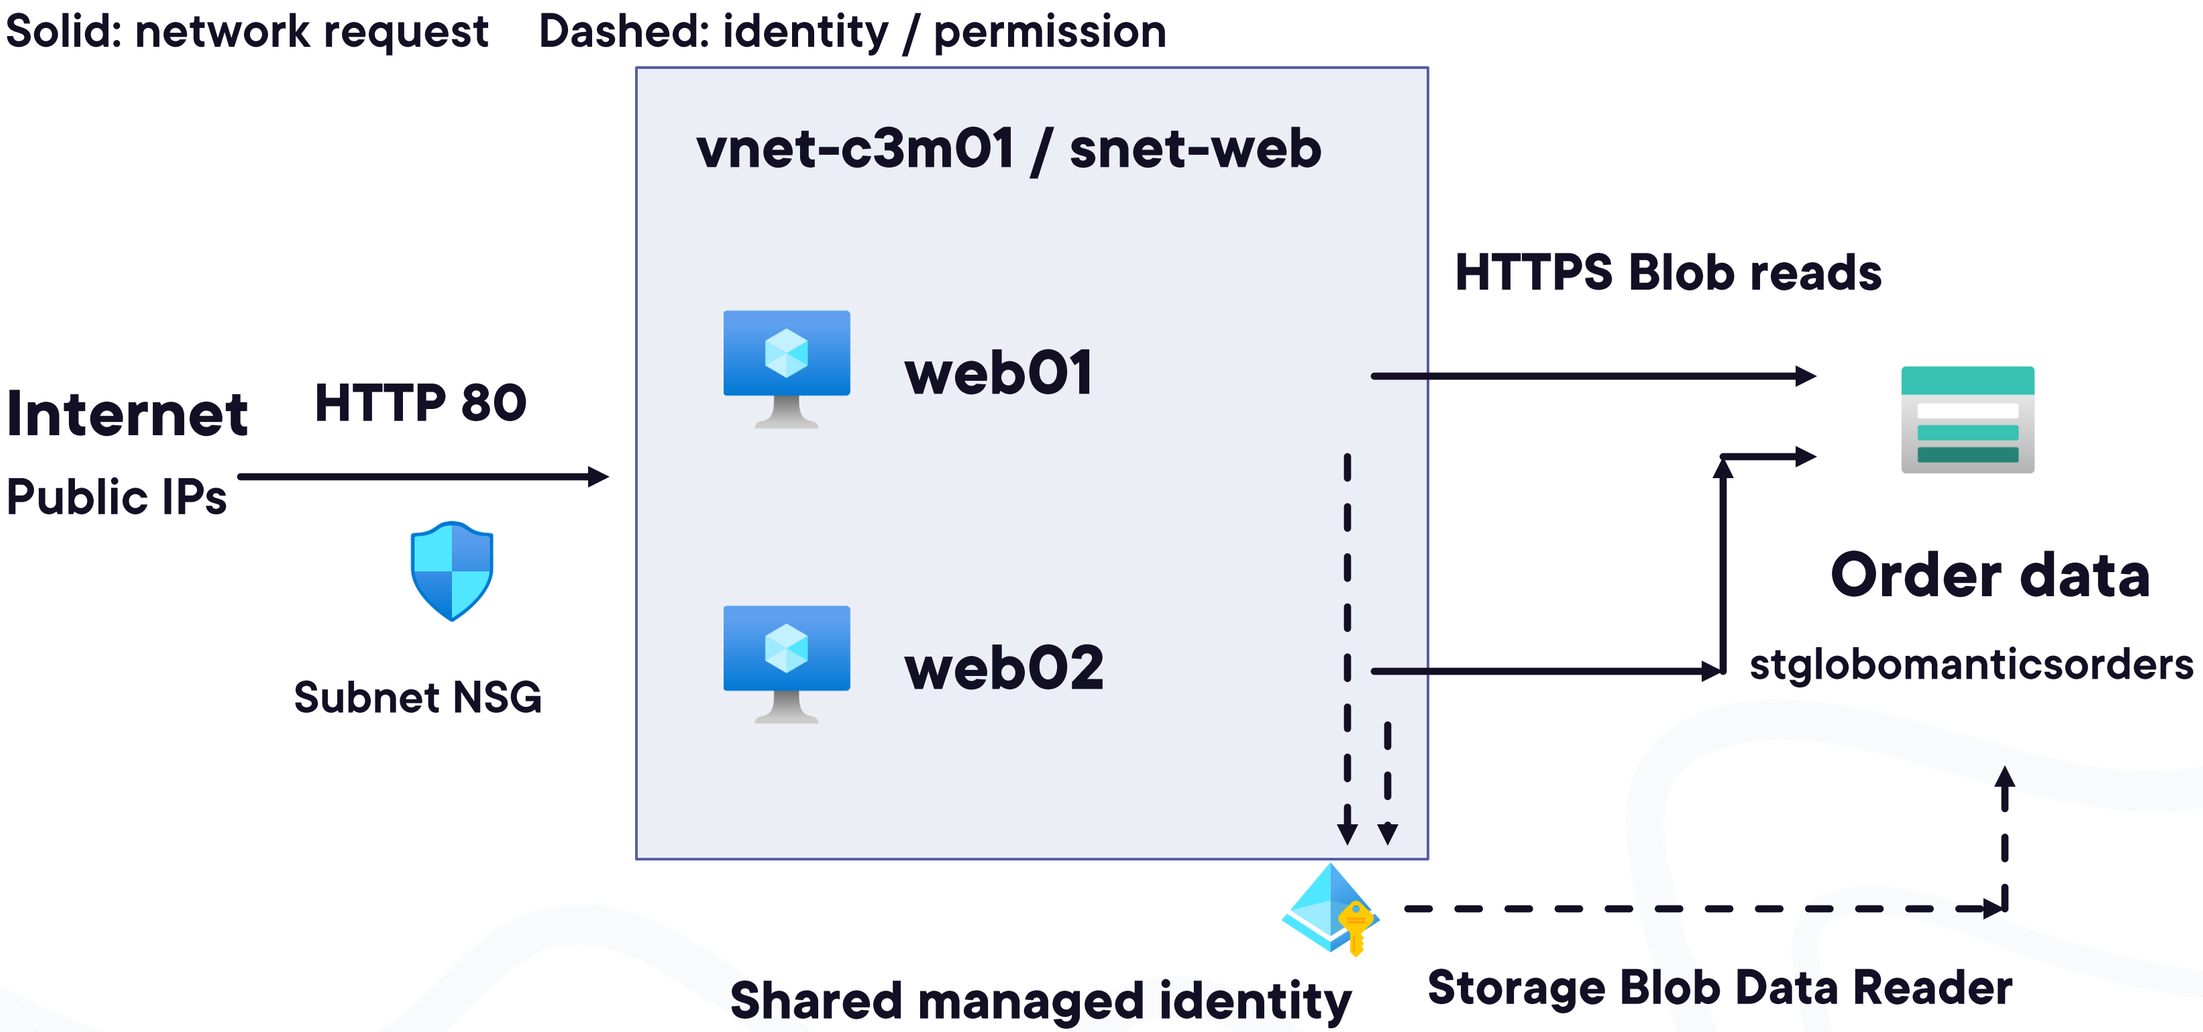

Approved inventory: owned assets, scanned daily and billed

Dependency: third-party infrastructure your assets rely on

Monitor Only: related assets outside your control

Prioritize remediation with Security Exposure Management

The order-data fixture: reachability and permission

Separate network reachability from data permission

Microsoft Learn, posture management with Exposure Management

“Attack paths terminate at critical assets. Before attack paths provide value, classify your critical assets.”

Microsoft Learn, Security Exposure Management attack paths

Demo: Follow an attack path to a critical asset

Open an attack path in the Microsoft Defender portal, find its choke point, then read the Cloud Security initiative

Practice question and key points

Theme: Hybrid and multicloud posture management

Question

Globomantics runs Azure, AWS and on-premises servers. You need one posture view with no new AWS agents. What should you recommend?

A. Enable Foundational CSPM and report the Azure score

B. Assign the benchmark initiative across Azure

C. Connect AWS agentlessly and onboard servers with Arc

D. Send every server's logs to one Log Analytics workspace

Theme: Hybrid and multicloud posture management

Answer: C

Globomantics runs Azure, AWS and on-premises servers. You need one posture view with no new AWS agents. What should you recommend?

A. Enable Foundational CSPM and report the Azure score

B. Assign the benchmark initiative across Azure

C. Connect AWS agentlessly and onboard servers with Arc

D. Send every server's logs to one Log Analytics workspace

Checking out with Globomantics

Measure against the benchmark, and name the score you report

Put Azure, AWS, and on-premises on one posture plane

Protect workloads by risk, and watch the edge from outside

Classify critical assets, then fix choke points first
