Checking in with Globomantics

Eleven plants run controllers that can't take a patch or an agent

Servers run in Azure, AWS, and the Globomantics datacenter

Personal phones read company email, and PCs share one admin password

Can one endpoint strategy cover all of it? Where does it break first?

Specify server security across platforms and clouds

Specify the plan by what the workload needs

Plan 1

EDR through Defender for Endpoint

Agent-based vulnerability assessment

Regulatory compliance assessment

The baseline for every server

Plan 2

Agentless vulnerability and malware scans

File integrity monitoring

Just-in-time access on supported platforms

Sensitive, exposed, or critical servers

Server onboarding and effective protection

Globomantics design

ERP VM in Azure

Native Azure resource

Servers plan

Verify required components

Datacenter file server

Arc resource

Policy + Servers plan

Defender for Endpoint

Plan 1 + premium vulnerability management*

Partner-hosted server

Design comparison

*Direct route with P2; no Arc policy

Inventory presence, effective plan and functioning protection are separate facts.

Specify mobile and client security by ownership model

Let ownership decide the control

Corporate-owned

Full Intune enrollment

Security baselines and encryption enforced

Remote wipe of the whole device

Compliance state feeds Conditional Access

Personal

App protection without enrollment

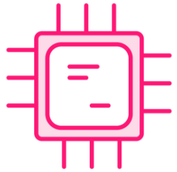

Corporate data stays in managed apps

Selective wipe of corporate data only

Approved apps and threat level gate access

Specify security for IoT devices and embedded systems

Specify device identity before the device ships

Hardware root of trust: a TPM or HSM in every device

X.509 certificates per device, never a shared key

Provisioning: the Device Provisioning Service, zero touch

Constrained devices sit behind an Azure IoT Edge gateway

Evaluate Microsoft Defender for IoT for the plant floor

Map a control to every class of device

Device class		Control that covers it
Servers Azure, AWS, datacenter	agent on device	**Defender for Servers** Defender for Endpoint agent
Laptops and phones Corporate or personal	policy on device	**Intune and Defender for Endpoint** Enrollment or app protection
Connected Equipment Devices Globomantics ships	identity in device	**Hardware root of trust** X.509 identity, IoT Edge gateway

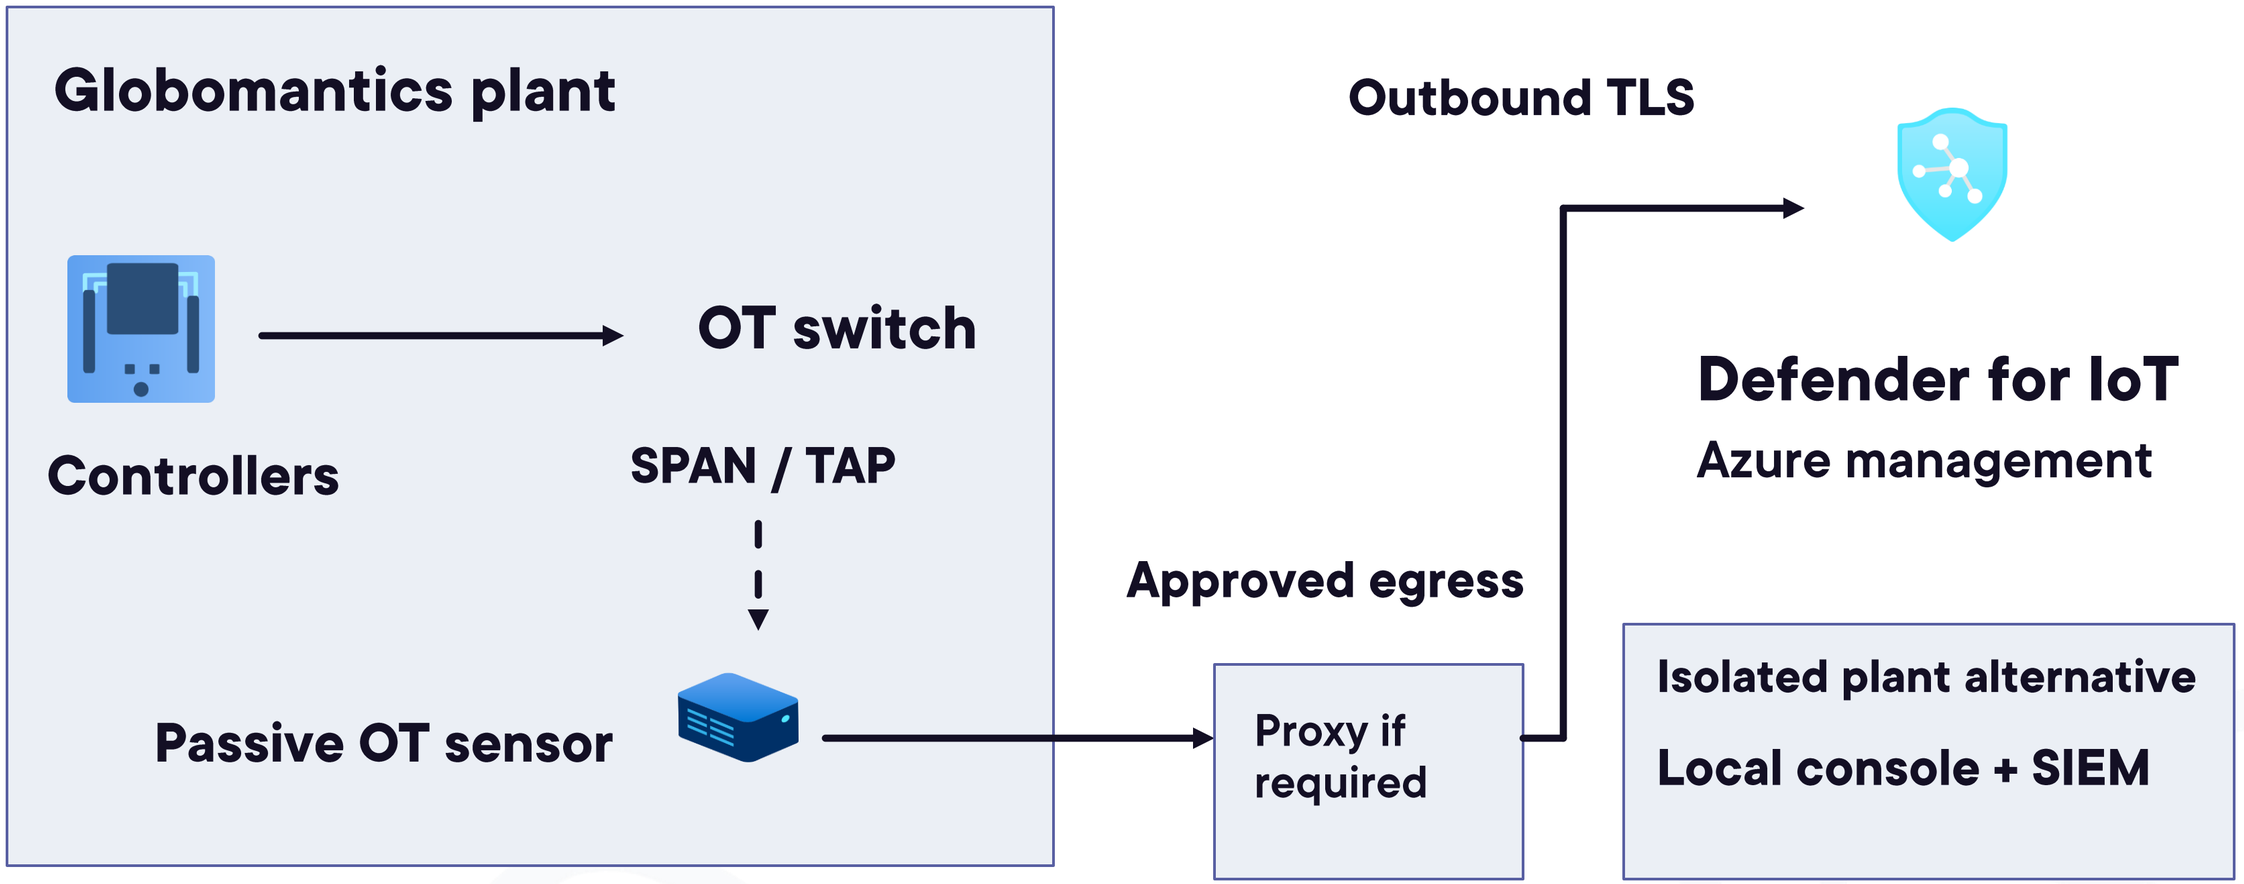

IT and OT seam: no agent below this line

Plant controllers Eleven plants	sensor on network	**Defender for IoT sensor** Mirrored traffic, no agent

Below the seam, the control moves off the device and onto the network

Plant monitoring without an inline sensor

Globomantics design

A traffic copy observes the process. Segmentation controls who can reach it.

Specify security baselines for servers and clients

Baseline application and assessment

Apply: OSConfig or SCT for servers, Intune baselines for clients

Assess: Azure Machine Configuration reports through Azure Policy

Approve exceptions with a reason, owner and review date

Evaluate Windows LAPS for local administrator accounts

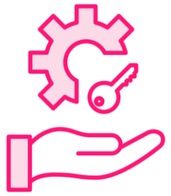

Give every device its own expiring admin password

Rotation: a unique password per device, changed on a schedule

Backup: Microsoft Entra ID or Active Directory

Recovery: role-based access, Conditional Access, and audit

Migration: retire legacy Microsoft LAPS

Demo: Read server coverage and plan fit in Defender for Cloud

Read which plan each Globomantics server carries and how it connects, then decide which server moves to Plan 2 first

Practice question and key points

Theme: Securing OT and industrial control systems

Question

Globomantics plant controllers can't run agents. Plants have no cloud connection and use a local SIEM. What should you recommend?

A. Air-gapped Defender for IoT sensors with syslog to local SIEM

B. The on-premises management console for every plant

C. Defender for Endpoint on each plant controller

D. Cloud-connected Defender for IoT sensors in each plant

Theme: Securing OT and industrial control systems

Answer: A

Globomantics plant controllers can't run agents. Plants have no cloud connection and use a local SIEM. What should you recommend?

A. Air-gapped Defender for IoT sensors with syslog to local SIEM

B. The on-premises management console for every plant

C. Defender for Endpoint on each plant controller

D. Cloud-connected Defender for IoT sensors in each plant

Checking out with Globomantics

Specify the server plan by criticality, and connect through Arc

Enroll corporate devices; protect the data on personal ones

Below the IT and OT seam, monitor from the network

Baseline every device, and retire the shared admin password
